-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 03 February 2009.
 2a) This action is FINAL. 2b) This action is non-final.
 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) Claim(s) 25,27-31,34-38,40,41 and 43-47 is/are pending in the application.
 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
 5) Claim(s) _____ is/are allowed.
 6) Claim(s) 25,27-31,34-38,40,41 and 43-47 is/are rejected.
 7) Claim(s) _____ is/are objected to.
 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) The specification is objected to by the Examiner.
 10) The drawing(s) filed on 15 December 2005 is/are: a) accepted or b) objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
 a) All b) Some * c) None of:
 1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This office action is responsive to a REQUEST FOR CONTINUED EXAMINATION entered February 3, 2009 for the patent application 10/560839.

Status of Claims

2. Claims 25, 27-31, 34-38, 40, 41 and 43-47 were rejected in the last Office Action dated October 3, 2008.

As a response to the October 3, 2008 office action, Applicant has Amended claim 25.

Claims 25, 27-31, 34-38, 40, 41 and 43-47 are now presented for examination in this office action.

Drawings

3. The drawings are objected to under 37 CFR 1.83(a) because they fail to show labels for empty numbered boxes/circles as described in the specification. Any structural detail that is essential for a proper understanding of the disclosed invention should be shown in the drawing. MPEP § 608.02(d). Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing

should not be labeled as “amended.” If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either “Replacement Sheet” or “New Sheet” pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Objections

4. Claim 25 is objected to because of the following informalities:

Claim 25, Line 13: The phrase “program into to objects” appears to be a typographical error and should read “program into objects.”

Claim 25, Line 8: Should include a comma at the end of the line.

Appropriate correction is required.

Claim Rejections - 35 USC § 112

5. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

6. Regarding claim 30, the phrase "such as" renders the claim indefinite because it is unclear whether the limitations following the phrase are part of the claimed invention. See MPEP § 2173.05(d).

Claim Rejections - 35 USC § 102

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

8. Claims 25, 27-31, 34-38, 40, 41 and 43-47 are rejected under 35 U.S.C. 102(b) as being anticipated by Stripf et al. (U.S. Patent Number: 6,263,487).

As to independent claim 25, Stripf discloses a method for executing a program for an industrial automation system (e.g., program for controlling and industrial process) (see Col. 1, Lines 11-15), comprising:

providing a computer unit (e.g., Figure 1) with:

input aids, output aids, a display device (e.g., operating and monitoring devices for displaying) (see Col. 3, Lines 23-33), modules and functions respectively representing sub-tasks of an automation solution (e.g., a class of software function blocks and a class of input/output modules) (see Col. 4, Lines 15-21) a program which is structured from the modules and functions (e.g., control program formed by multiple software function blocks...the software

function blocks have an object-oriented design) (see Col. 2, Lines 9-20; Figure 2 and Col. 2, Lines 44-46);

converting the modules and functions of the structured program into objects (e.g., translates the control program into an object-oriented machine language e.g., java byte code) (see Col. 2, Lines 44-55) to create a machine-independent program (e.g., the portability of the code ensures that a programmable controller with a execution system in the form of a Java byte code interpreter can process the Java function blocks sent to the programmable controller over the internet independently of a processor hardware architecture of the programmable controller) (see Col. 2, Lines 35-40) in the form of a hierarchical tree (see byte code as a form of an hierarchical tree as further limited by applicant's claim 30; and see supporting document: wikipedia online encyclopedia, page 11 for an example of java byte code data structure such as trees); and

loading the machine-independent program in the form of the at least one hierarchical tree into the corresponding components of the automation system (e.g., Java byte code loaded into programmable controllers) (see Col. 2, Lines 55-57), wherein the corresponding components of the automation system execute the machine-independent program present in the form of the at least one hierarchical tree with the aid of at least one object machine assigned to the corresponding components of the automation system (e.g., the portability of the code ensures that a programmable controller with a execution system in the form

of a Java byte code interpreter can process the Java function blocks sent to the programmable controller over the internet independently of a processor hardware architecture of the programmable controller) (see Col. 2, Lines 35-40), and wherein the at least one object machine provides operators and objects from which the machine-independent program is provided in the form of the at least one hierarchical tree (e.g., operating and monitoring software program for creating and displaying a process image containing multiple image objects, where the image objects are in relation to in interaction with software function blocks of the control program) (see Col. 3, Lines 23-38); and

 during or after loading of the machine-independent program, instantiating the operators using the at least one object machine into corresponding components of the automation system (e.g., software function blocks designed so that they are loadable and can be tied into the control program while it is running, the software function blocks have an object-oriented design) (see Col. 2, Lines 12-20); and

 converting (e.g., translates) the symbolic representation of the hierarchical tree to physical addresses to generate a loadable program (e.g., loaded into programmable controllers) in the form of an executable program or operator tree (e.g., compiler to create the machine codes) (see Col. 2, Line 44 to Col. 3, Line 3).

As to independent claim 38, Stripf discloses a device for executing a program for an industrial automation system (e.g., program for controlling and industrial process) (see Col. 1, Lines 11-15), comprising:

at least one computer unit with input aids, output aids and a display device (e.g., operating and monitoring devices for displaying) (see Col. 3, Lines 23-33);

a component for modeling and/or creating modules and functions, which respectively represent the sub-tasks of an automation solution (e.g., a class of software function blocks and a class of input/output modules) (see Col. 4, Lines 15-21);

a component for structuring the modules and functions and for networking the same, to form at least one hierarchical tree as at least one machine-independent program (e.g., software function blocks to be loadable directly into a programmable controller over the Internet and the Internet communications interface, so that they can be tied in to the control program while it is running, the software function blocks have an object-oriented design) (see Col. 1, Line 65 to Col. 2, Line 25; Figure 2 and Col. 2, Lines 44-46); and

a component to load the machine-independent program in the form of at least one hierarchical tree into the corresponding components of the automation system with the corresponding components of the automation system executing the machine-independent program present in the form of the at least one hierarchical tree (e.g., Java byte code loaded into programmable controllers) (see Col. 2, Lines 55-57), wherein at least one object machine is assigned to the corresponding components of the automation system to execute the machine-independent programs (e.g., the portability

of the code ensures that a programmable controller with a execution system in the form of a Java byte code interpreter can process the Java function blocks sent to the programmable controller over the internet independently of a processor hardware architecture of the programmable controller) (see Col. 2, Lines 35-40), and wherein the at least one object machine provides operators and objects from which the machine-independent program is provided in the form of the hierarchical tree (e.g., operating and monitoring software program for creating and displaying a process image containing multiple image objects, where the image objects are in relation to in interaction with software function blocks of the control program) (see Col. 3, Lines 23-38);

a component to instantiate the operators using the at least one object machine during or after the loading of the machine-independent program into corresponding components of the automation system (e.g., software function blocks designed so that they are loadable and can be tied into the control program while it is running, the software function blocks have an object-oriented design) (see Col. 2, Lines 12-20); and

a component to convert (e.g., translates) the symbolic representation of the at least one hierarchical tree to physical addresses to generate a loadable program (e.g., loaded into programmable controllers) in the form of an executable program or operator tree (e.g., compiler to create the machine codes) (see Col. 2, Line 47 to Col. 3, Line 3).

As to independent claim 47, Stripf discloses a computer program implementing a method for executing a program for an industrial automation system (e.g., program for controlling and industrial process) (see Col. 1, Lines 11-15), comprising:

providing a computer unit with input aids, output aids and a display device (e.g., operating and monitoring devices for displaying) (see Col. 3, Lines 23-33), having modules and functions respectively representing sub-tasks of an automation solution being modeled and/or created using the input aids and optionally the display device (e.g., a class of software function blocks and a class of input/output modules) (see Col. 4, Lines 15-21), having the modules and functions being structured and networked using the input aids and optionally the display device as to form a hierarchical tree as a machine-independent program (e.g., software function blocks to be loadable directly into a programmable controller over the Internet and the Internet communications interface, so that they can be tied in to the control program while it is running, the software function blocks have an object-oriented design) (see Col. 1, Line 65 to Col. 2, Line 25; Figure 2 and Col. 2, Lines 44-46);

loading the machine-independent program in the form of the hierarchical tree into the corresponding components of the automation system (e.g., Java byte code loaded into programmable controllers) (see Col. 2, Lines 55-57), wherein the corresponding components of the automation system execute the machine-independent program present in the form of the hierarchical tree with the aid of at least one object machine assigned to the corresponding components of the automation system (e.g., the portability of the code ensures that a programmable controller with a execution system in the form of a Java byte code interpreter can process the Java function blocks sent to the programmable controller over the internet independently of a processor hardware architecture of the programmable controller) (see Col. 2, Lines 35-40), and wherein the

at least one object machine provides operators and objects from which the machine-independent program is provided in the form of the hierarchical tree (e.g., operating and monitoring software program for creating and displaying a process image containing multiple image objects, where the image objects are in relation to in interaction with software function blocks of the control program) (see Col. 3, Lines 23-38); and

 during or after loading of the machine-independent program, instantiating the operators using the at least one object machine into corresponding components of the automation system (e.g., software function blocks designed so that they are loadable and can be tied into the control program while it is running, the software function blocks have an object-oriented design) (see Col. 2, Lines 12-20); and

 converting (e.g., translates) the symbolic representation of the hierarchical tree to physical addresses to generate a loadable program (e.g., loaded into programmable controllers) in the form of an executable program or operator tree (e.g., compiler to create the machine codes) (see Col. 2, Line 47 to Col. 3, Line 3).

As to dependent claim 27, Stripf teaches the method according to claim 25, wherein the machine-independent program is present in the form of at least one hierarchical object or operator tree in the corresponding components of the automation system and are processed interpretatively (e.g., byte code interpreter 10) (see Col. 2, Line 47 to Col. 3, Line 3).

As to dependent claim 28, Stripf teaches the method according to claim 27, wherein the machine-independent program is present in the form of at least one object

or operator tree with a structure equivalent or similar to the representation of the program in the display device (e.g., Figure 2) (see Col. 2, Lines 44-46).

As to dependent claim 29, Stripf teaches the method according to claim 25, wherein the machine-independent program is loaded into the corresponding components of the automation system using a machine-independent, symbolic representation of the hierarchical tree (e.g., Java byte code loaded into programmable controllers) (see Col. 2, Lines 55-57).

As to dependent claim 30, Stripf teaches the method according to claim 29, wherein the machine-independent and symbolic representation of the hierarchical tree is in the form of a byte code or a markup language such as extended markup language (e.g., byte code) (see Col. 2, Line 36).

As to dependent claim 31, Stripf teaches the method according to claim 25, wherein the object machine is configured as a real-time object machine with deterministic response and cycle times (e.g., cycle time) (see Col. 4, Lines 33-48).

As to dependent claim 34, Stripf teaches the method according to claim 25, wherein the object machine is implemented as a function unit that is closed and that processes the at least one hierarchical tree to a runtime system of the automated system (e.g., software function blocks to be loadable directly into a programmable controller over the Internet and the Internet communications interface, so that they can be tied in to the control program while it is running, the software function blocks have an object-oriented design) (see Col. 1, Line 65 to Col. 2, Line 25; Figure 2 and Col. 2, Lines 44-46).

As to dependent claim 35, Stripf teaches the method according to claim 27, wherein the object machine is implemented in a distributed manner as at least one object, with the hierarchical object or operator tree processing itself (e.g., distributed programmable controller) (see Figure 1; and Col. 1, Lines 54-56).

As to dependent claim 36, Stripf teaches the method according to claim 25, wherein the modules and functions are assigned model information and/or meta-information using the input aids and/or the display device (e.g., a class of software function blocks and a class of input/output modules) (see Col. 4, Lines 15-21).

As to dependent claim 37, Stripf teaches the method according to claim 27, wherein the objects of the machine-independent program present as a hierarchical object or operator tree are assigned a collection of infrastructure services or infrastructure functions that access the objects via containers assigned to the objects such that an infrastructure service or an infrastructure function can be used by all the objects (e.g., the portability of the code ensures that a programmable controller with a execution system in the form of a Java byte code interpreter can process the Java function blocks sent to the programmable controller over the internet independently of a processor hardware architecture of the programmable controller) (see Col. 2, Lines 35-40; Figure 2 and Col. 2, Lines 44-46).

As to dependent claim 40, Stripf teaches the device according to claim 38, wherein the machine-independent program is present in the form of at least one object or operator tree with a structure equivalent or similar to the representation of the program in the display device (e.g., Figure 2) (see Col. 2, Lines 44-46).

As to dependent claim 41, Stripf teaches the device according to claim 38, wherein the object machine is configured as a real-time object machine with deterministic response and cycle times (e.g., cycle time) (see Col. 4, Lines 33-48).

As to dependent claim 43, Stripf teaches the device according to claim 38, further comprising a device for assigning model information and/or meta-information to the modules and functions (e.g., a class of software function blocks and a class of input/output modules) (see Col. 4, Lines 15-21).

As to dependent claim 44, Stripf teaches the device according to claim 38, wherein the object machine is implemented as a function unit that is closed and processes the at least one hierarchical tree to a runtime system of the automated invention (e.g., software function blocks to be loadable directly into a programmable controller over the Internet and the Internet communications interface, so that they can be tied in to the control program while it is running, the software function blocks have an object-oriented design) (see Col. 1, Line 65 to Col. 2, Line 25; Figure 2 and Col. 2, Lines 44-46).

As to dependent claim 45, Stripf teaches the device according to claim 38, wherein the object machine is implemented in a distributed manner as at least one object, with the hierarchical object or operator tree processing itself (e.g., distributed programmable controller) (see Figure 1; and Col. 1, Lines 54-56).

As to dependent claim 46, Stripf teaches the device according to claim 38, wherein the objects of the machine-independent program present as a hierarchical object or operator tree are assigned a collection of infrastructure services or

infrastructure functions that access the objects via containers assigned to the objects such that an infrastructure service or infrastructure function can be used by all the objects (e.g., the portability of the code ensures that a programmable controller with a execution system in the form of a Java byte code interpreter can process the Java function blocks sent to the programmable controller over the internet independently of a processor hardware architecture of the programmable controller) (see Col. 2, Lines 35-40; Figure 2 and Col. 2, Lines 44-46).

Response to Arguments

9. Applicant's amendment and arguments filed February 3, 2009 have been fully considered. The amendment does not overcome the original art rejection and the arguments are not persuasive. The following are the Examiner's observations in regard thereto.

Applicant Argues:

Stripf does not expressly or inherently teach or suggest "a machine-independent program in the form of a hierarchical tree".

Examiner Responds:

Examiner is not persuaded. See prior art Col. 2, Lines 35-40 for byte code (e.g., hierarchical tree, as further limited by applicant's claim 30). And see supporting document: wikipedia online encyclopedia, page 11 for an example of java byte code data structure such as trees. Under such considerations, the prior art anticipates a machine-independent program in the form of a hierarchical tree.

Conclusion

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tejal J. Gami whose telephone number is (571) 270-1035. The examiner can normally be reached on Monday-Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Albert DeCady can be reached on (571) 272-3819. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
